Intelligent Chatbot to Analyze and Monitor Websites

CHAT BOT

- A chatbot is a piece of software that conducts a conversation via auditory or textual methods.
- Such programs are often designed to convincingly simulate how a human would behave as a conversational partner, although as of 2019, they are far short of being able to pass the Turing test.
- Chatbots are typically used in dialog systems for various practical purposes including customer service or information acquisition. Some chatbots use sophisticated natural language processing systems, but many simpler ones scan for keywords within the input, then pull a reply with the most matching keywords, or the most similar wording pattern, from a database.

to create a basic chat bot using python

MACHINE LEARNING= Decision Tree Algorithms

- In this algorithm a decision tree is used to map decisions and their possible consequences, including chances, costs and utilities.
- This method allows the problem to be approached logically and stepwise to get to the right conclusion.
- An important algorithm that evolved from this algorithm is the Random Tree algorithm. This algorithm uses multiple trees to avoid overfitting that often occurs with using decision trees.

Building a Chatbot using NLTK Natural Language Processing with Python provides a practical introduction to programming for language processing.

- Downloading and installing NLTK
Install NLTK: run `pip install nltk`
- Installing NLTK Packages
import NLTK and run `nltk.download()`.
- Text Pre- Processing with NLTK
Converting the entire text into uppercase or lowercase, so that the algorithm does not treat the same words in different cases as different

Algorithm

Relevance

Applications

- Chatbot applications streamline interactions between people and services, enhancing customer experience. At the same time, they offer companies new opportunities to improve the customers engagement process and operational efficiency by reducing the typical cost of customer service.
- To be successful, a chatbot solution should be able to effectively perform both of these tasks.
- Human support plays a key role here: Regardless of the kind of approach and the platform, human intervention is crucial in configuring, training and optimizing the chatbot system.

Scraping webpages using scrapy

November 19, 2019

Objective

Scraping
webpages
using scrapy

Intro

Statement

Approaches

Flow Chart

Algorithm

Relevance

Applications

- **Scrap information from webpages of a given website using Scrapy**

What is Web scraping ? What is it's relevance ?

Scraping
webpages
using scrapy

Intro

Statement

Approaches

Flow Chart

Algorithm

Relevance

Applications

Web scraping refers to the process of collecting and organizing data from a web page. The steps involved in web scraping are Fetching web pages and Extracting data from it

Applications of web scraping

- For contact scraping
- For web indexing
- For data mining
- For comparing and doing researches on data

Existing methods

Scraping
webpages
using scrapy

Intro

Statement

Approaches

Flow Chart

Algorithm

Relevance

Applications

1.Human Copy-Paste

A human being manually examines the webpage and copy paste required data. Failure rate is almost zero in this traditional technique

2.Text pattern matching

An approach to extract information from webpage using UNIX **grep** command or regular expression matching facilities of programming languages

3.Using web-scraping frameworws/softwarees

These frameworks/softwarees gives the facilities to create web scraping bots(spiders/crawlers) to scrape data from webpages. These spiders try to recognize structure of the page automatically and extracts the data and gives the facility to process and store them in specific format

4.Computer vision webpage analysis

Employing the features of machine learning and computer vision to idenetify and extract data from webpage. This can be described as computerised version of human copy-paste with a failure rate $\neq 0$

Applications

Using web-scraping framework

The proposed methodology is to scrape webpages using a software/framework. Here we are using "Scrapy", a framework written in python to generate and deploy spiders to extract data from a webpage

Why Scrapy ?

- ① Faster and automated way to scrape webpages
- ② Easy to use & implement
- ③ Have selectors to specify data field needs to be extracted
- ④ Have pipelines to refine extracted data

writing a spell checker program to check the correctness of a given document

INTRODUCTION

Scraping
webpages
using scrapy

Intro

Statement

Approaches

Flow Chart

Algorithm

Relevance

Applications

We have to create a user program that checks the correctness of a document and makes necessary changes if needed. Spell-checking features are often embedded in software or services, such as a word processor, email client, electronic dictionary, or search engine.

Applications

Grammarly is an AI powered tool.

- 1 So it's basically a computer program or algorithm which studies and compares your sentence against hundreds of similar ones that are listed in their database.
- 2 Grammarly, as mentioned earlier, is an AI powered tool that weighs your writing by comparing it against authentic rules and sentence patterns
- 3 Grammarly's algorithms flag potential issues in the text and suggest context-specific corrections for grammar, spelling and usage, wordiness, style, punctuation, and even plagiarism using patterns in its database.

Applications

Ginger Software is an Israeli start-up company.

- 1 Ginger Software that has developed language enhancement technology that uses statistical algorithms in conjunction with natural language processing
- 2 Ginger Software uses patented software algorithms that deal with natural language processing. The company claims that the algorithm allows it to correct the written sentences with relatively high accuracy (eliminating up to 95 percent of writing errors) compared to standard spell checkers.
- 3 Its unique algorithm allows the software to understand the context of the sentence rather than correcting based solely on a word.
- 4 The software operates on the logic of sentence context in addition to the memory of a database of words.

Approaches

Flow Chart

Algorithm

Relevance

Applications

- ➊ Input URL from user using chatbot
- ➋ run scrapy process using os library
- ➌ scrap main page of website. Output scraped data to data.json file
- ➍ If user wants to follow to associated links .scrape the follow links too.
- ➎ After scraping, open data.json using file handler.
- ➏ Check for spelling and offensive words in json file
- ➐ If found listed to chat bot as website analysis report
- ➑ end

Applications

A bot was created which analyses and monitors a website periodically. It uses help of three sub programs that is chat bot , spell checker which also checks for offensive words and a scrapy tool which will scrap the desired web page These sub programs is later on implemented together to create bot which creates a bot that that checks for the content of a website given and detects for spelling and offensive words if present in it and also makes sure to notify of any outside activity.

Initially chat bot was executed and acts as user friendly interface and can be used to communicate to the bot and later on used to analyze the website which is our main concern. The chat bot makes sure to pick up the URL of the website needed and is given to spell checker to be executed. The chat bot can also generate response on questions asked by the user based on keyword matching.

The scrapy package used here to scrap data from desired websites. It also provides an option to follow scrapping to associated links and stores the data into a document.

Spell checker checks the output file where the scrapped data is stored and checks for spelling if present and also checks for offensive words If found the words are returned to chat bot and displayed as the analysis report . It also checks for any external activities.
